

Ixekizumab
taltz

- NAME OF THE MEDICAL PRODUCT**
Ixekizumab (Taltz®) 80 mg solution for injection in pre-filled pen
- QUALITATIVE AND QUANTITATIVE COMPOSITION**
Each pre-filled pen contains 80 mg ixekizumab in 1 mL.
Ixekizumab (Taltz®) is produced in CHO cells by recombinant DNA technology.
For the full list of excipients, see section 7.1.
- PHARMACEUTICAL FORM**
Solution for injection.
The solution is clear and colorless to slightly yellow.
- PHARMACOLOGIC CATEGORY**
Immunosuppressant, Interleukin inhibitor
- CLINICAL PARTICULARS**

5.1 Therapeutic indications
Plaque psoriasis
Ixekizumab (Taltz®) is indicated for the treatment of moderate to severe plaque psoriasis in adults who are candidates for systemic therapy.
Psoriatic arthritis
Ixekizumab (Taltz®), alone or in combination with methotrexate, is indicated for the treatment of active psoriatic arthritis in adult patients who have responded inadequately to, or who are intolerant to one or more disease-modifying anti-rheumatic drug (DMARD) therapies (see section 6.1).
Axial spondyloarthritis
Ankylosing spondylitis (radiographic axial spondyloarthritis)
Ixekizumab (Taltz®) is indicated for the treatment of adult patients with active ankylosing spondylitis who have responded inadequately to conventional therapy.
Non-radiographic axial spondyloarthritis
Ixekizumab (Taltz®) is indicated for the treatment of adult patients with active non-radiographic axial spondyloarthritis with objective signs of inflammation as indicated by elevated C-reactive protein (CRP) and/or magnetic resonance imaging (MRI) who have responded inadequately to nonsteroidal anti-inflammatory drugs (NSAIDs).

5.2 Posology and method of administration
This medicinal product is intended for use under the guidance and supervision of a physician experienced in the diagnosis and treatment of conditions for which it is indicated.
Posology
Plaque psoriasis
The recommended dose is 160 mg by subcutaneous injection (two 80 mg injections) at week 0, followed by 80 mg (one injection) at weeks 2, 4, 6, 8, 10, and 12, then maintenance dosing of 80 mg (one injection) every 4 weeks (Q4W).
Psoriatic arthritis
The recommended dose is 160 mg by subcutaneous injection (two 80 mg injections) at week 0, followed by 80 mg (one injection) every 4 weeks thereafter. For psoriatic arthritis patients with concomitant moderate to severe plaque psoriasis, the recommended dosing regimen is the same as for plaque psoriasis.
Axial spondyloarthritis (radiographic and non-radiographic)
The recommended dose is 160 mg (two 80 mg injections) by subcutaneous injection at week 0, followed by 80 mg every 4 weeks (see section 6.1 for further information).

For all indications (plaque psoriasis, psoriatic arthritis, axial spondyloarthritis) consideration should be given to discontinuing treatment in patients who have shown no response after 16 to 20 weeks of treatment. Some patients with initially partial response may subsequently improve with continued treatment beyond 20 weeks.
Special populations
Elderly (≥ 65 years)
No dose adjustment is required (see section 6.2).
There is limited information in subjects aged ≥ 75 years.
Renal or hepatic impairment
Ixekizumab (Taltz®) has not been studied in these patient populations. No dose recommendations can be made.
Pediatric population
The safety and efficacy of ixekizumab (Taltz®) in children below the age of 18 years have not yet been established. No data are available.
Method of administration
Subcutaneous use
Ixekizumab (Taltz®) is for subcutaneous injection. Injection sites may be alternated. If possible, areas of the skin that show psoriasis should be avoided as injection sites. The solution/the pen must not be shaken.
After proper training in subcutaneous injection technique, patients may self-inject ixekizumab (Taltz®) if a healthcare professional determines that it is appropriate. However, the physician should ensure appropriate follow-up of patients. Comprehensive instructions for administration are given in the package leaflet and the user manual.

5.3 Contraindications
Serious hypersensitivity to the active substance or to any of the excipients listed in section 7.1.
Clinically important active infections (e.g., active tuberculosis, see section 5.4).
5.4 Special warnings and precautions for use
Traceability
In order to improve the traceability of biological medicinal products, the name and the batch number of the administered product should be clearly recorded.
Infections
Treatment with ixekizumab (Taltz®) is associated with an increased rate of infections such as upper respiratory tract infection, oral candidiasis, conjunctivitis, and sinus infections (see section 5.8).
Ixekizumab (Taltz®) should be used with caution in patients with clinically important chronic infection or a history of recurrent infection. Patients should be instructed to seek medical advice if signs or symptoms suggestive of an infection occur. If an infection develops, patients should be carefully monitored and ixekizumab (Taltz®) discontinued if the patient is not responding to standard therapy or if the infection becomes serious. Ixekizumab (Taltz®) should not be resumed until the infection resolves.
Ixekizumab (Taltz®) must not be given to patients with active tuberculosis (TB). Anti-TB therapy prior to initiation of ixekizumab (Taltz®) in patients with latent TB should be considered.
Hypersensitivity
Serious hypersensitivity reactions, including some cases of anaphylaxis, angioedema, urticaria and, rarely, late (10-14 days following injection) serious hypersensitivity reactions including widespread urticaria, dyspnea and high antibody titers have been reported. If a serious hypersensitivity reaction occurs, administration of ixekizumab (Taltz®) should be discontinued immediately and appropriate therapy initiated.
Inflammatory bowel disease (including Crohn's disease and ulcerative colitis)
Cases of new or exacerbations of inflammatory bowel disease have been reported with ixekizumab (see section 5.8). Ixekizumab is not recommended in patients with inflammatory bowel disease. If a patient develops signs and symptoms of inflammatory bowel disease or experiences an exacerbation of pre-existing inflammatory bowel disease, ixekizumab should be discontinued and appropriate medical management should be initiated.

Immunizations
Ixekizumab (Taltz®) should not be used with live vaccines. No data are available on the response to live vaccines; there are insufficient data on response to inactivated vaccines (see section 6.1).
Excipients
This medicinal product contains less than 1 mmol sodium (23 mg) per 80 mg dose, that is to say essentially "sodium-free".
5.5 Interaction with other medicinal products and other forms of interaction
In plaque psoriasis studies, the safety of ixekizumab (Taltz®) in combination with other immunomodulatory agents or phototherapy has not been evaluated.
In population pharmacokinetic analyses, clearance of ixekizumab was not affected by concomitant administration of oral corticosteroids, NSAIDs, sulfasalazine, or methotrexate.
Cytochrome P450 substrates
Results from an interaction study in patients with moderate-to-severe psoriasis determined that 12 weeks of administration of ixekizumab with substances metabolized by CYP3A4 (i.e., mizolamol), CYP2C9 (i.e., warfarin), CYP2C19 (i.e., omeprazole), CYP1A2 (i.e., caffeine) or CYP2D6 (i.e., dextromethorphan) does not have a clinically significant impact on the pharmacokinetics of these substances.

5.6 Fertility, pregnancy and lactation
Women of childbearing potential
Women of childbearing potential should use an effective method of contraception during treatment and for at least 10 weeks after treatment.
Pregnancy
There is a limited amount of data from the use of ixekizumab in pregnant women. Animal studies do not indicate direct or indirect harmful effects with respect to pregnancy, embryonic/fetal development, parturition or post-natal development (see section 6.3). As a precautionary measure, it is preferable to avoid the use of ixekizumab (Taltz®) during pregnancy.
Breast-feeding
It is not known whether ixekizumab is excreted in human milk or absorbed systemically after ingestion. However, ixekizumab is excreted at low levels in the milk of nonhuman monkeys. A decision should be made whether to discontinue breastfeeding or to discontinue ixekizumab (Taltz®) taking into account the benefit of breastfeeding for the child and the benefit of therapy for the woman.
Fertility
The effect of ixekizumab on human fertility has not been evaluated. Animal studies do not indicate direct or indirect harmful effects with respect to fertility (see section 6.3).
5.7 Effects on ability to drive and use machines
Ixekizumab (Taltz®) has no or negligible influence on the ability to drive and use machines.

5.8 Undesirable effects
Summary of the safety profile
The most frequently reported adverse reactions were injection site reactions (15.5%) and upper respiratory tract infections (16.4%) (most frequently nasopharyngitis).
Tabulated list of adverse reactions
Adverse reactions from clinical studies and postmarketing reports (Table 1) are listed by MedDRA system organ class. Within each system organ class, the adverse reactions are ranked by frequency, with the most frequent reactions first. Within each frequency group, adverse reactions are presented in order of decreasing seriousness. In addition, the corresponding frequency category for each adverse reaction is based on the following convention: very common (≥1/10); common (≥1/100 to <1/10); uncommon (≥1/1,000 to <1/100); rare (≥1/10,000 to <1/1,000); very rare (<1/10,000).
A total of 8,956 patients have been treated with ixekizumab (Taltz®) in blinded and open-label clinical studies in plaque psoriasis, psoriatic arthritis, axial spondyloarthritis, and other autoimmune conditions. Of these, 6,385 patients were exposed to ixekizumab (Taltz®) for at least one year, cumulatively representing 19,833 patient years of exposure.
Table 1. List of adverse reactions in clinical studies and postmarketing reports

System organ class	Frequency	Adverse reaction
Infections and infestations	Very common	Upper respiratory tract infection
	Common	Tinea infection, Herpes simplex (mucocutaneous)
	Uncommon	Influenza, Rhinitis, Oral candidiasis, Conjunctivitis, Cellulitis
Blood and lymphatic system disorders	Uncommon	Neutropenia, Thrombocytopenia
	Uncommon	Angioedema
Immune system disorders	Uncommon	Angioedema
	Rare	Anaphylaxis
Respiratory, thoracic and mediastinal disorders	Common	Oropharyngeal pain
	Common	Nausea
Gastrointestinal disorders	Uncommon	Inflammatory bowel disease
	Uncommon	Urticaria, Rash, Eczema
Skin and subcutaneous disorders	Uncommon	Injection site reactions ^a
	Very common	Injection site reactions ^a

^a See section description of selected adverse reactions
Description of selected adverse reactions
Injection site reactions
The most frequent injection site reactions observed were erythema and pain. These reactions were predominantly mild to moderate in severity and did not lead to discontinuation of ixekizumab (Taltz®).
In the plaque psoriasis studies, injection site reactions were more common in subjects with a body weight < 60 kg compared with the group with a body weight ≥ 60 kg (25% vs. 14% for the combined Q2W and Q4W groups). In the psoriatic arthritis studies, injection site reactions were more common in subjects with a body weight < 100 kg compared with the group with a body weight ≥ 100 kg (24% vs. 13% for the combined Q2W and Q4W groups). In the axial spondyloarthritis studies, injection site reactions were similar in subjects with a body weight < 100 kg compared with the group with a body weight ≥ 100 kg (14% vs. 9% for the combined Q2W and Q4W groups). The increased frequency of injection site reactions in the combined Q2W and Q4W groups did not result in an increase in discontinuations in either the plaque psoriasis, the psoriatic arthritis or the axial spondyloarthritis studies.
Infections
In the placebo-controlled period of the phase III clinical studies in plaque psoriasis, infections were reported in 27.2% of patients treated with ixekizumab (Taltz®) for up to 12 weeks compared with 22.9% of patients treated with placebo.

Ixekizumab (Taltz®) 80 mg solution for injection in pre-filled pen

The majority of infections were non-serious and mild to moderate in severity, most of which did not necessitate treatment discontinuation. Serious infections occurred in 13 (0.6%) of patients treated with ixekizumab (Taltz®) and in 3 (0.4%) of patients treated with placebo (see section 5.4). Over the entire treatment period infections were reported in 52.8% of patients treated with ixekizumab (Taltz®) (46.9 per 100 patient years). Serious infections were reported in 1.6% of patients treated with ixekizumab (Taltz®) (1.5 per 100 patient years).
Infection rates observed in psoriatic arthritis and axial spondyloarthritis clinical studies were similar to those observed in the plaque psoriasis studies with the exception of the frequencies of the adverse reactions of influenza and conjunctivitis which were common in patients with psoriatic arthritis.
Laboratory assessment of neutropenia and thrombocytopenia
In plaque psoriasis studies, 9% of patients receiving ixekizumab (Taltz®) developed neutropenia. In most cases, the blood neutrophil count was ≥ 1,000 cells/mm³. Such levels of neutropenia may persist, fluctuate or be transient. 0.1% of patients receiving ixekizumab (Taltz®) developed a neutrophil count < 1,000 cells/mm³. In general, neutropenia did not require discontinuation of ixekizumab (Taltz®). 3% of patients exposed to ixekizumab (Taltz®) had a shift from a normal baseline platelet value to <150,000 platelet cells/mm³ to ≥75,000 cells/mm³. Thrombocytopenia may persist, fluctuate or be transient.
The frequency of neutropenia and thrombocytopenia in psoriatic arthritis and axial spondyloarthritis clinical studies is similar to that observed in the plaque psoriasis studies.
Immunogenicity
Approximately 9–17% of plaque psoriasis patients treated with ixekizumab (Taltz®) at the recommended dosing regimen developed anti-drug antibodies, the majority of which were low titers and not associated with reduced clinical response up to 60 weeks of treatment. However, approximately 1% of patients treated with ixekizumab (Taltz®) had confirmed neutralizing antibodies associated with low drug concentrations and reduced clinical response.
In psoriatic arthritis patients treated with ixekizumab (Taltz®) at the recommended dosing regimen up to 52 weeks, approximately 11% developed anti-drug antibodies, the majority of which were low titers and approximately 8% had confirmed neutralizing antibodies. No apparent association between the presence of neutralizing antibodies and impact on drug concentration or efficacy was observed.
In radiographic axial spondyloarthritis patients treated with ixekizumab (Taltz®) at the recommended dosing regimen up to 16 weeks, 5.2% developed anti-drug antibodies, the majority of which were low titer, and 1.5% of patients had neutralizing antibodies (NAbs). In these 3 patients, NAbs-positive samples had low ixekizumab concentrations and none of these patients achieved an ASAS40 assessment. In non-radiographic axial spondyloarthritis patients treated with ixekizumab (Taltz®) at the recommended dosing regimen for up to 52 weeks, 8.9% developed anti-drug antibodies, all of which were low titer; no patient had neutralizing antibodies; and no apparent association between the presence of anti-drug antibodies and drug concentration, efficacy, or safety was observed.
Across all indications, an association between immunogenicity and treatment emergent adverse events has not been clearly established.
Reporting of suspected adverse reactions
Reporting suspected adverse reactions after authorization of the medicinal product is important. It allows continued monitoring of the benefit/risk balance of the medicinal product. Healthcare professionals are asked to report any suspected adverse reactions (see section 12).
5.9 Overdose
Doses up to 180 mg have been administered subcutaneously in clinical trials without dose-limiting toxicity. Overdoses up to 240 mg, subcutaneously, as a single administration in clinical trials, have been reported without any serious adverse events. In the event of overdose, it is recommended that the patient be monitored for any signs or symptoms of adverse reactions and appropriate symptomatic treatment be instituted immediately.

6. PHARMACOLOGICAL PROPERTIES
6.1 Pharmacodynamic properties
Pharmacotherapeutic group: immunosuppressants, interleukin inhibitors, ATC code: L04AC13
Mechanism of action
Ixekizumab is an IgG4 monoclonal antibody that binds with high affinity (<3 pM) and specificity to interleukin 17A (both IL-17A and IL-17AF). Elevated concentrations of interleukin 17A have been implicated in the pathogenesis of psoriasis by promoting proliferation and activation, as well as in the pathogenesis of psoriatic arthritis and axial spondyloarthritis by driving inflammation leading to erosive bone damage and pathological new bone formation. Neutralization of IL-17A by ixekizumab inhibits these actions. Ixekizumab does not bind to ligands IL-17B, IL-17C, IL-17D, IL-17E or IL-17F.
In vitro binding assays confirmed that ixekizumab does not bind to human Fcγ receptors 1, IIa, and IIa or to complement component C1q.
Pharmacodynamic effects
Ixekizumab modulates biological responses that are induced or regulated by IL-17A. Based on psoriatic skin biopsy data from a phase I study, there was a dose-related trend towards decreased epidermal thickness, number of proliferating keratinocytes, T cells, and dendritic cells, as well as reductions in local inflammatory markers from baseline to day 43. As a direct consequence treatment with ixekizumab reduced erythema, induration and desquamation present in plaque psoriasis lesions.
Ixekizumab (Taltz®) has been shown to lower (within 1 week of treatment) levels of C-reactive protein, which is a marker of the inflammation.
Clinical efficacy and safety
Plaque psoriasis
The efficacy and safety of ixekizumab (Taltz®) were assessed in three randomized, double-blind, placebo-controlled phase III studies in adult patients (N=3,866) with moderate to severe plaque psoriasis who were candidates for phototherapy or systemic therapy (UNCOVER-1, UNCOVER-2, and UNCOVER-3). The efficacy and safety of ixekizumab (Taltz®) were also evaluated versus etanercept (UNCOVER-2 and UNCOVER-3). Patients randomized to ixekizumab (Taltz®) who were sPGA (0.1) responders (static Physicians Global Assessment) at week 12 were re-randomized to receive placebo or ixekizumab (Taltz®) for an additional 48 weeks (UNCOVER-1 and UNCOVER-2); patients randomized to placebo, etanercept or ixekizumab (Taltz®) who were sPGA (0.1) non-responders received ixekizumab (Taltz®) for up to 48 weeks. In addition, long-term efficacy and safety were evaluated in all three studies for up to a total of 5 years in patients who participated through the entire study.
64% of patients had received prior systemic therapy (biologic, conventional systemic or psoralen and ultraviolet A (PUVA)), 43.5% prior phototherapy, 49.3% prior conventional systemic therapy, and 26.4% prior biologic therapy. 14.9% had received at least one anti-TNF alpha agent, and 8.7% an anti-IL-12/IL-23. 23.4% of patients had a history of psoriatic arthritis at baseline.
In all three studies, the co-primary endpoints were the proportion of patients who achieved a PASI 75 response (Psoriasis Area and Severity Index) and an sPGA of 0 ("clear" or "1" (minimal)) at week 12 versus placebo. The median baseline PASI score ranged from 17.4 to 19.3; 48.3% to 51.2% of patients had a baseline sPGA score of severe or very severe, and mean baseline Itch Numeric Rating Scale (Itch NRS) ranged from 6.3 to 7.1.
Clinical response at 12 weeks
UNCOVER-1 randomized 1,296 patients (1:1:1) to receive either placebo or ixekizumab (Taltz®) (80 mg every two or four weeks [Q2W or Q4W]) following a 160 mg starting dose) for 12 weeks.

Table 2. Efficacy results at week 12 in UNCOVER-1

Endpoints	Number of patients (%)					Difference from placebo in response rate (95% CI)
	Placebo (N=431)	Ixekizumab (Taltz®) 80 mg Q4W (N=347)	Ixekizumab (Taltz®) 80 mg Q2W (N=351)	Etanercept 50 mg twice weekly (N=358)	Ixekizumab (Taltz®) 80 mg Q2W (N=452)

Abbreviations: N = number of patients in the intent-to-treat population
Note: patients with missing data were counted as non-responders
^a p < 0.001 compared with placebo
^b p < 0.001 compared with etanercept
^c Patients with Itch NRS ≥ 4 at baseline: placebo N = 158, ixekizumab (Taltz®) 80 mg Q4W N = 313, ixekizumab (Taltz®) 80 mg Q2W N = 320, etanercept N = 312
Patients randomized to ixekizumab (Taltz®) were associated with a fast onset of efficacy with > 50% reduction in mean PASI by week 2 (Figure 1). The percentage of patients achieving PASI 75 was significantly greater for ixekizumab (Taltz®) compared with placebo and etanercept as early as week 1. Approximately 25% of patients treated with ixekizumab (Taltz®) achieved a PASI score < 5 by week 2, more than 55% achieved the PASI score < 5 by week 4, and increased to 85% by week 12 (compared to 3%, 14% and 50% for etanercept). Significant improvement in Itch severity was seen at week 1 in patients treated with ixekizumab (Taltz®).
Figure 1. PASI score, percent improvement at each post baseline visit (mBOOP) in the intent-to-treat population during the induction dosing period - UNCOVER-2 and UNCOVER-3

The efficacy and safety of ixekizumab (Taltz®) was demonstrated regardless of age, gender, race, body weight, PASI baseline severity, plaque location, concurrent psoriasis and previous treatment with a biologic. Ixekizumab (Taltz®) was efficacious in systemic treatment-naive, biologic-naive, biologic/anti-TNF-exposed and biologic/anti-TNF-failure patients. For patients identified as an sPGA (0.1) non-responder to etanercept at week 12 in UNCOVER-2 (N = 200) and who were switched to ixekizumab (Taltz®) 80 mg Q4W after a 4-week washout period, 73% and 83.5% of patients were able to achieve sPGA (0.1) and PASI 75, respectively, after 12 weeks of treatment with ixekizumab (Taltz®).
In 2 clinical studies that included an active comparator (UNCOVER-2 and UNCOVER-3), the rate of serious adverse events was 1.9% for both etanercept and ixekizumab (Taltz®), the rate of discontinuation due to adverse events was 1.2% for etanercept and 2.0% for ixekizumab (Taltz®). The rate of infections was 21.5% for etanercept and 26.0% for ixekizumab (Taltz®), with 0.4% being serious for etanercept and 0.5% for ixekizumab (Taltz®).
Maintenance of response at week 60 and up to 5 years
Patients originally randomized to ixekizumab (Taltz®) and who were responders at week 12 (i.e., sPGA score of 0.1) in UNCOVER-1 and UNCOVER-2 were re-randomized to an additional 48 weeks of treatment with placebo or ixekizumab (Taltz®) (80 mg every four or twelve weeks [Q4W or Q12W]).
For sPGA (0.1) responders at week 12 re-randomized to treatment withdrawal (i.e., placebo), the median time to relapse (sPGA ≥ 3) was 164 days in integrated UNCOVER-1 and UNCOVER-2 studies. Among these patients, 71.5% regained at least an sPGA (0.1) response within 12 weeks of restarting treatment with ixekizumab (Taltz®) 80 mg Q4W.
Table 5. Maintenance of response and efficacy at week 60 (Studies UNCOVER-1 and UNCOVER-2)

Endpoints	Number of patients (%)						Difference from placebo in response rate (95% CI)
	80 mg Q4W (induction) / Placebo (maintenance) (N=191)	80 mg Q2W (induction) / Placebo (maintenance) (N=211)	80 mg Q4W (induction) / 80 mg Q4W (maintenance) (N=195)	80 mg Q2W (induction) / 80 mg Q4W (maintenance) (N=221)	80 mg Q4W (induction) / 80 mg Q4W (maintenance)	80 mg Q2W (induction) / 80 mg Q4W (maintenance)	
Maintained sPGA of "0" (clear) or "1" (minimal)	12 (6.3)	16 (7.6)	134 (68.7) ^a	173 (78.3) ^a	62.4 (55.1, 69.6)	70.7 (64.2, 77.2)	
Maintained or achieved sPGA 0 (clear)	3 (1.6)	6 (2.8)	96 (49.2) ^a	130 (58.8) ^a	47.7 (40.4, 54.9)	56.0 (49.1, 62.8)	
Maintained or achieved PASI 75	15 (7.9)	19 (9.0)	145 (74.4) ^a	184 (83.3) ^a	66.5 (59.3, 73.7)	74.3 (68.0, 80.5)

Abbreviations: N = number of patients in the analysis population
Note: patients with missing data were counted as non-responders
^a p < 0.001 compared with placebo
Ixekizumab (Taltz®) was efficacious in the maintenance of response in systemic treatment-naive, biologic-naive, biologic/anti-TNF-exposed and biologic/anti-TNF-failure patients.
Significantly greater improvements at week 12 from baseline compared to placebo and etanercept were demonstrated in nail psoriasis (as measured by the Nail Psoriasis Severity Index (NAPSI)), in scalp psoriasis (as measured by Psoriasis Scalp Severity Index (PSSI)) and in palmoplantar psoriasis (as measured by Psoriasis Palmoplantar Severity Index (PPSSI)) and were maintained at week 60 in patients treated with ixekizumab (T

Efficacy in genital psoriasis

A randomized, double-blind, placebo-controlled study (XORA-2) was conducted in 149 adult subjects (24% females) with moderate to severe genital psoriasis (sPGA of Genitalia score of ≥ 3), a minimum body surface area (BSA) involvement of 1% (80.4% had a BSA $\geq 10\%$) and previous failure of or intolerance to at least one topical therapy for genital psoriasis. Patients had at least moderate plaque psoriasis (defined as sPGA score of ≥ 2 and being candidates for phototherapy and/or systemic therapy) for at least 6 months.

Subjects randomized to bekalzumab (Taltz[®]) received an initial dose of 160 mg followed by 80 mg every 2 weeks for 12 weeks. The primary endpoint was the proportion of patients who achieved at least a 0 ("clear" or "1") (minimal) response on the sPGA of Genitalia (sPGA of Genitalia 0/1). At week 12, significantly more subjects in the bekalzumab (Taltz[®]) group than placebo group achieved a sPGA of Genitalia 0/1 and a sPGA 0/1 independent of baseline BSA (baseline BSA 1% - <10% resp. $\geq 10\%$; sPGA of Genitalia 0 or "1": bekalzumab (Taltz[®]) 71%, resp. 75%; placebo: 0%, resp. 13%). A significantly greater proportion of patients treated with bekalzumab (Taltz[®]) achieved a reduction in the PIDs of severity of genital pain, genital itch, impact of genital psoriasis on sexual activity, and Dermatology Quality of Life Index (DLQI).

Table 8. Efficacy results at week 12 in Adults with genital psoriasis in trial XORA-0, NRP¹

Endpoints	bekalzumab (Taltz [®]) N=75	Placebo N=74	Difference from placebo (95% CI)
Number of patients (N) randomized			
sPGA of Genitalia 0 or "1"	73%	8%	65% (53%, 77%)
sPGA 0 or "1"	73%	3%	71% (60%, 81%)
DLQI 0 ^b	45%	3%	43% (31%, 55%)
N with baseline GPSS Itch NRS Score ≥ 3	N=62	N=60	
GPSS Itch Itch (≥ 3 point improvement)	60%	8%	51% (37%, 65%)
N with baseline SFQ Item 2 Score ≥ 2	N=37	N=42	
SFQ-Item 2 score, "0" (never limited) or "1" (rarely limited)	78%	21%	57% (39%, 75%)

¹ Abbreviations: NRI = Non-Responder Imputation; sPGA = static Physician Global Assessment; GPSS = Genital Psoriasis Symptom Scale; SFQ = Sexual Frequency Questionnaire; DLQI = Dermatology Quality of Life Index[®]. Total DLQI score of 0 indicates skin condition has no effect at all on patient's life. sPGA of 0 or "1" is equivalent to "clear" or "minimal"; NRS = Numeric Rating Scale.

Psoriatic arthritis

bekalzumab (Taltz[®]) was assessed in two randomized, double-blind, placebo-controlled phase II studies in 780 patients with active psoriatic arthritis (≥ 3 swollen and ≥ 2 tender joints). Patients had a diagnosis of psoriatic arthritis (Classification Criteria for Psoriatic Arthritis (CASPAR) criteria) for a median of 5.33 years and had current plaque psoriasis skin lesions (94.0%) or a documented history of plaque psoriasis, with 12% of patients with moderate to severe plaque psoriasis at baseline. Over 58.9% and 22.3% of the psoriatic arthritis patients had enthesitis at baseline, respectively. Primary endpoint of both studies was American College of Rheumatology (ACR) 20 response at week 24, followed by a long-term extension period from Week 24 to Week 156 (3 years).

In Psoriatic Arthritis Study 1 (SPIRIT-P1), patients naive to biologic therapy with active psoriatic arthritis were randomized to placebo, adalimumab 40 mg once every 2 weeks (active control reference arm), bekalzumab (Taltz[®]) 80 mg once every 2 weeks (Q2W), or 80 mg once every 4 weeks (Q4W). Both bekalzumab (Taltz[®]) regimens included a 160 mg starting dose. 85.3% of patients in this study had received prior treatment with ≥ 1 csDMARD. 53% of patients had concomitant use of MTX at a mean weekly dose of 15.8 mg. 67% of patients who had concomitant use of MTX had a dose of 15 mg or greater. Patients with an inadequate response at week 16 received rescue therapy (modification to background therapy). Patients on bekalzumab (Taltz[®]) Q2W or Q4W remained on their originally assigned dose of bekalzumab (Taltz[®]). Patients receiving adalimumab or placebo were re-randomized 1:1 to bekalzumab (Taltz[®]) Q2W or Q4W at week 16 or 24 based on responder status. 243 patients completed the extension period of 3 years on bekalzumab (Taltz[®]).

Psoriatic Arthritis Study 2 (SPIRIT-P2) enrolled patients who were previously treated with an anti-TNF agent and discontinued the anti-TNF agent for either lack of efficacy or intolerance (anti-TNF-R patients). Patients were randomized to subcutaneous injections of placebo, bekalzumab (Taltz[®]) 80 mg once every 2 weeks (Q2W), or 80 mg once every 4 weeks (Q4W). Both bekalzumab (Taltz[®]) regimens included a 160 mg starting dose. 56% and 35% of patients were inadequate responders to 1 anti-TNF or 2 anti-TNF, respectively. SPIRIT-P2 evaluated 363 patients, of whom 41% had concomitant use of MTX at a mean weekly dose of 16.1 mg. 73.2% of patients who had concomitant use of MTX had a dose of 15 mg or greater. Patients with an inadequate response at week 16 received rescue therapy (modification to background therapy). Patients on bekalzumab (Taltz[®]) Q2W or Q4W remained on their originally assigned dose of bekalzumab (Taltz[®]). Patients receiving placebo were re-randomized 1:1 to bekalzumab (Taltz[®]) Q2W or Q4W at week 16 or 24 based on responder status. 168 patients completed the extension period of 3 years on bekalzumab (Taltz[®]).

Signs and symptoms

Treatment with bekalzumab (Taltz[®]) resulted in significant improvement in measures of disease activity compared to placebo at week 24 (see Table 9).

Table 9. Efficacy results in SPIRIT-P1 and SPIRIT-P2 at week 24

Abbreviations: ACR 20/50/70 = American College of Rheumatology 20%/50%/70% response rate; ADA = adalimumab; BSA = body surface area; CI = confidence interval; Q4W = bekalzumab (Taltz[®]) 80 mg every 4 weeks; Q2W = bekalzumab (Taltz[®]) 80 mg every 2 weeks; N = number of patients in the analysis population; n = number of patients in the specified category; NRI = non-responder imputation; PASI 100 = psoriasis area and severity index (PASI) 100 response at baseline; PBO = placebo; PBO = placebo; PBO = placebo.

Note: Patients who were rescued with IV Ig or discontinued or with missing data were imputed as non-responders for week 24 analyses. Concomitant csDMARDs included MTX, sulfasalazine, and NSAIDs.

^a p<0.05; ^b p<0.01; ^c p<0.001 compared with placebo.

In patients with pre-existing dactylitis or enthesitis, treatment with bekalzumab (Taltz[®]) Q4W resulted in improvement in dactylitis and enthesitis at week 24 compared to placebo (resolution: 78% vs. 24%; p<0.001, and 39% vs. 21%, p<0.01, respectively).

In patients with $\geq 3\%$ BSA, the improvement in skin clearance at week 12 was measured by 75% improvement in Psoriasis Area Severity Index (PASI 75), was 67% (94/141) for those treated with the Q4W dosing regimen, and 9% (12/134) for those treated with placebo (p<0.001) in the psoriasis area and severity index (PASI) 75 analysis. At week 12, 29 patients (27%) and 36 patients (34%) were observed to have ACR20, ACR50, ACR70, and MDA response, respectively, at Week 16.

In SPIRIT-P2, 70 patients completed 3 years of Q4W bekalzumab treatment. Among the 122 patients who were randomized to bekalzumab Q4W (NRI analysis in ITT population), 55 patients (46%), 39 patients (32%), 24 patients (20%) and 33 (27%) were observed to have ACR20, ACR50, ACR70, and MDA response, respectively, at Week 156.

Radiographic response

In SPIRIT-P1, inhibition of progression of structural damage was assessed radiographically and expressed as the change in modified Total Sharp Score (mTSS) and its components, the Erosion Score (ES) and the Joint Space Narrowing score (JSN) at weeks 24 and 52, compared to baseline. Week 24 data are presented in Table 10.

Table 10. Change in modified Total Sharp Score in SPIRIT-P1

	PBO (N=106)	bekalzumab (Taltz [®]) Q4W (N=107)	bekalzumab (Taltz [®]) Q2W (N=103)	ADA (N=101)	Difference from placebo (95% CI)	
					bekalzumab (Taltz [®]) Q4W	bekalzumab (Taltz [®]) Q2W
Baseline score, mean (SD)	17.6 (28.62)	19.2 (32.68)	15.2 (28.86)	15.9 (27.37)	NA	NA
Change from baseline at week 24, LSM (SE)	0.51 (0.092)	0.18 (0.090)	0.09 (0.091)	0.13 (0.093)	-0.23 (-0.57, 0.09) ^b	-0.42 (-0.66, -0.19) ^c

Abbreviations: ADA = adalimumab; CI = confidence interval; Q4W = bekalzumab (Taltz[®]) 80 mg every 4 weeks; Q2W = bekalzumab (Taltz[®]) 80 mg every 2 weeks; LSM = least squares mean; N = number of patients in the analysis population; PBO = placebo; SE = standard error; SD = standard deviation.

^a p<0.01; ^b p<0.001 compared with placebo.

Radiographic joint damage progression was inhibited by bekalzumab (Taltz[®]) (Table 10) at week 24, and the percentage of patients with no radiographic joint damage progression (defined as a change from baseline in mTSS of ≤ 0.5) from randomization to week 24 was 94.8% for bekalzumab (Taltz[®]) Q2W (p<0.001), 89.0% for bekalzumab (Taltz[®]) Q4W (p=0.026), 95.8% for adalimumab (p<0.001), all compared to 77.4% for placebo. At week 52, the mean change from baseline in mTSS was 0.27 for placebo/bekalzumab (Taltz[®]) Q4W, 0.54 for bekalzumab (Taltz[®]) Q4W/bekalzumab (Taltz[®]) Q4W, and 0.32 for adalimumab/bekalzumab (Taltz[®]) Q4W. The percentage of patients with no radiographic joint damage progression from randomization to week 52 was 90.9% for placebo/bekalzumab (Taltz[®]) Q4W, 85.6% for bekalzumab (Taltz[®]) Q4W/bekalzumab (Taltz[®]) Q4W, and 89.4% for adalimumab/bekalzumab (Taltz[®]) Q4W. Patients had no structural progression from baseline (defined as mTSS ≤ 0.5) in the treatment arms as follows: Placebo/bekalzumab (Taltz[®]) Q4W 81.5% (n=22/27), bekalzumab (Taltz[®]) Q4W/bekalzumab (Taltz[®]) Q4W 73.6% (N=53/72), and adalimumab/bekalzumab (Taltz[®]) Q4W 88.2% (N=30/34).

Physical function and health-related quality of life

In both SPIRIT-P1 and SPIRIT-P2, patients treated with bekalzumab (Taltz[®]) Q2W (p<0.001) and Q4W (p<0.001) showed significant improvement in physical function compared to patients treated with placebo as assessed by Health Assessment Questionnaire-Disability Index (HAQ-DI) at week 24, and maintained at Week 52 in SPIRIT-P1.

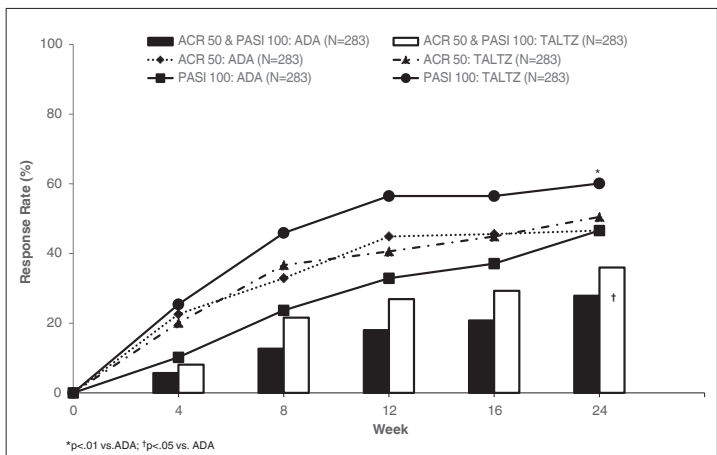

bekalzumab (Taltz[®]) treated patients reported improvements in health-related quality of life as measured by the Physical Component Summary of the Short-Form-36 Health Survey (SF-36 PCS) score (p<0.001). There were also improvements demonstrated in fatigue as assessed by Fatigue severity NRS scores (p<0.001).

Post-marketing phase 4, direct comparative study

Efficacy and safety of bekalzumab (Taltz[®]) was investigated in a multicenter, randomized, open-label, rater-blinded, parallel-group study (SPIRIT-H2) compared to adalimumab (ADA) in 566 patients with PsA who were naive to biologic disease-modifying anti-rheumatic drugs (csDMARD). Patients were stratified at baseline based on concomitant csDMARD use and presence of moderate-to-severe psoriasis (PASI ≥ 12 , BSA ≥ 10 and sPGA ≥ 3).

bekalzumab (Taltz[®]) was superior to ADA on the primary study objective: simultaneous achievement of ACR 50 and PASI 100 response at week 24 (bekalzumab (Taltz[®]) 36.0% vs ADA 27.9%; p=0.036; 95% confidence interval [0.5%, 15.5%]). bekalzumab (Taltz[®]) also showed non-inferiority (pre-specified margin of $\leq 12\%$) to ADA on ACR 50 (ITT analysis: bekalzumab (Taltz[®]) 50.5% vs ADA 46.6%; 3.9% difference vs ADA; 95% confidence interval [-4.3%, 12.1%]). PPS analysis bekalzumab (Taltz[®]): 52.3%; ADA: 53.1%; difference: -0.8% (CI: -1.0, 3.8, 8.7%) and superiority on PASI 100 at week 24 (60.1% with bekalzumab (Taltz[®]) vs 46.6% with ADA, p<0.001), which were the major secondary endpoints in the study. At Week 52 a higher proportion of patients treated with bekalzumab (Taltz[®]) versus ADA simultaneously achieved ACR50 and PASI 100 [39% (117/283) versus 26% (74/283)] and PASI 100 [64% (182/283) versus 41% (117/283)]. Responses to bekalzumab (Taltz[®]) and ADA treatment resulted in similar responses for ACR50 [49.8% (141/283) versus 49.8% (141/283)]. Responses to bekalzumab (Taltz[®]) were consistent when used as monotherapy or with concomitant use of methotrexate.

Figure 4. Primary endpoint (simultaneous ACR 50 & PASI 100) and major secondary endpoints (ACR 50; PASI 100) response rates week 0 - 24 (ITT population, NRI)¹**

** bekalzumab (Taltz[®]) 160 mg week 0, then 80 mg every 2 weeks to week 12 and every 4 weeks thereafter for patients with moderate to severe plaque psoriasis or 160 mg week 0, then 80 mg every 4 weeks for other patients; ADA 80 mg week 0, then 40 mg every 2 weeks from week 1 for patients with moderate to severe plaque psoriasis or 40 mg week 0, then 40 mg every 2 weeks for other patients. Significance level only provided for endpoint that was pre-defined and multiplicity tested.

axial spondyloarthritis

bekalzumab (Taltz[®]) was assessed in a total of 960 adult patients with axial spondyloarthritis in three randomized placebo-controlled studies (two in radiographic and one in non-radiographic axial spondyloarthritis).

Radiographic axial spondyloarthritis

bekalzumab (Taltz[®]) was assessed in a total of 657 patients in two randomized, double-blind, placebo-controlled studies (COAST-V and COAST-W) in adult patients who had active disease as defined by the Bath Ankylosing Spondylitis Disease Activity Index (BASDAI) ≥ 4 and total back pain ≥ 4 on a numeric rating scale despite non-steroidal anti-inflammatory drug (NSAID) therapy.

Across both studies at baseline, patients had symptoms for a mean of 17 years (median of 16 years). At baseline, approximately 32% of the patient were on a concomitant csDMARD.

COAST-V evaluated 341 biologic-naïve patients who were treated with either bekalzumab (Taltz[®]) 80 mg or 160 mg at Week 0 followed by 80 mg every 2 weeks (Q2W) or 4 weeks (Q4W), adalimumab 40 mg every 2 weeks, or with placebo. Patients receiving placebo were re-randomized at week 16 to receive bekalzumab (Taltz[®]) 160 mg starting dose, followed by 80 mg Q2W or Q4W. Patients receiving adalimumab were re-randomized at Week 16 to receive bekalzumab (Taltz[®]) 80 mg Q2W or Q4W.

COAST-W evaluated 316 patients who had prior experience with 1 or 2 TNF-inhibitors (90% were inadequate responders and 10% were intolerant to TNF inhibitors). All patients were treated with bekalzumab (Taltz[®]) 80 or 160 mg at Week 0 followed by 80 mg Q2W or Q4W, or with placebo. Patients receiving placebo were re-randomized at Week 16 to receive bekalzumab (Taltz[®]) 160 mg initial dose, followed by 80 mg Q2W or Q4W.

The primary endpoint in both studies was the percentage of patients achieving an Assessment of Spondyloarthritis International Society 40 (ASAS40) response at week 16.

Clinical response

In both studies, patients treated with bekalzumab (Taltz[®]) 80 mg Q2W or 80 mg Q4W demonstrated greater improvements in ASAS40 and ASAS20 responses compared to placebo at week 16 (Table 11). Responses were similar in patients regardless of concomitant therapies. In COAST-W, responses were seen regardless of the number of prior TNF inhibitors.

Table 11. Efficacy results in COAST-V and COAST-W at week 16

Change from baseline Baseline	7.7	3.6	4.1 (1.9, 6.2)	6.9**	6.6	1.4 (0.2, 2.6)
ASAS HI ^e	34.0	32.0	4.1 (1.9, 6.2)	33.5	30.5	3.0 (1.6, 4.4)

Abbreviations: N = number of patients in the intent-to-treat population; NRI = Non-responder imputation; patients with missing data were counted as non-responders.

ASAS HI = Assessment of Spondyloarthritis International Society Health Index; ASAS20 = Ankylosing Spondylitis Disease Activity Score; BASDAI = Bath Ankylosing Spondylitis Disease Activity Index; CRP = C-reactive protein; change from baseline at week 16; MRI Spine SPARCC = Spondyloarthritis Research Consortium of Canada Magnetic Resonance Imaging Scoring of the Spine (23-dimensional unit score).

^a At week 0, patients received 80 mg or 160 mg of bekalzumab (Taltz[®]).

^b An ASAS20 response is defined as a $\geq 20\%$ improvement and an absolute improvement from baseline of ≥ 1 unit (range 0 to 10) in ≥ 3 of 4 domains (Patient Global, Spinal Pain, Function, and Inflammation), and no worsening of $\geq 20\%$ and ≥ 1 unit (range 0 to 10) in the remaining domain. An ASAS40 response is defined as a $\geq 40\%$ improvement and an absolute improvement from baseline of ≥ 2 units in ≥ 3 of 4 domains without any worsening in the remaining domain.

Primary endpoint

The numbers of ITT patients with MRI data at baseline are as follows: COAST-V: bekalzumab (Taltz[®]), n = 81; PBO, n = 82; ADA, n = 85. COAST-W: bekalzumab (Taltz[®]), n = 88; PBO = 81.

^c BASDAI50 response defined as an improvement of $\geq 50\%$ of the BASDAI score from baseline.

^d ASAS HI: Assessment of Spondyloarthritis International Society Health Index (ASAS HI) across all domains.

^e The reported values are difference in % (95% CI) for categorical variables, and difference in LSM (95% CI) for continuous variables.

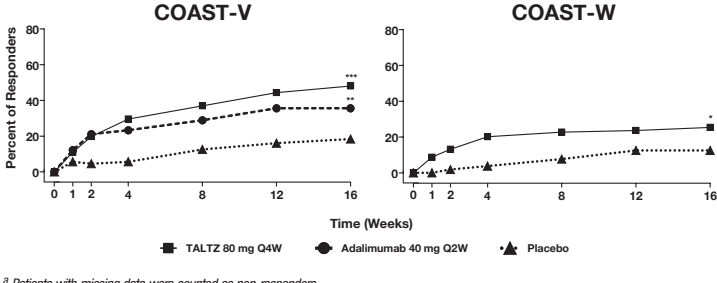

^a Not for analysis; not multiplicity tested.

^b pre-specified, but not multiplicity tested.

^c p<0.05; ^d p<0.01; ^e p<0.001 compared with placebo.

There were improvements in the main components of the ASAS40 response criteria (spinal pain, BASFI, patient global assessment, stiffness) and other measures of disease activity, including CRP, at week 16.

Figure 5. Percent of patients achieving ASAS40 responses in COAST-V and COAST-W through week 16, NRP¹

¹ Patients with missing data were counted as non-responders.

² p<0.05; ³ p<0.01; ⁴ p<0.001 compared with placebo.

Similar response in ASAS40 was seen in patients regardless of baseline CRP levels, baseline ASAS40 scores and MRI spine SPARCC scores. The ASAS40 response was demonstrated regardless of age, gender, race, disease duration, baseline body weight, baseline BASDAI score and prior biologic treatment.

In COAST-V and COAST-W efficacy was maintained up to week 52 as assessed by the endpoints presented in Table 11, including ASAS20, ASAS40, ASAS40, BASDAI, and ASAS HI response rates.

Health-Related Outcomes

Spinal pain showed improvements versus placebo as early as week 1, maintained through week 16 (bekalzumab (Taltz[®]) vs placebo: COAST-V: -2.2 vs -1.7 ; COAST-W: -2.4 vs -1.0); fatigue and spinal mobility showed improvements versus placebo at Week 16. Improvements in spinal pain, fatigue and spinal mobility were maintained through week 52.

Non-radiographic axial spondyloarthritis

bekalzumab (Taltz[®]) was assessed in a randomized, double-blind study with a 52-week placebo-controlled period (COAST-X) in 303 adult patients with active axial spondyloarthritis for at least 3 months. Patients must have had objective signs of inflammation indicated by elevated C-reactive protein (CRP) and/or sacroiliitis on magnetic resonance imaging (MRI), and no definitive radiographic evidence of structural damage on sacroiliac joints. Patients had active disease as defined by the Bath Ankylosing S
